Platelet glycoproteins and von Willebrand factor in patients with polycythemia vera. Eight normal subjects, two patients with polycythemia vera, and three patients with secondary erythrocytosis were tested for platelet glycoproteins and von Willebrand factor (vWF). Platelet glycoprotein IIb/IIIa (GPIIb/IIIa), fibrinogen receptor, was abnormally increased in the polycythemia vera patients and was normal in the other subjects. The other platelet glycoproteins studied were normal in the polycythemia vera patients and secondary erythrocytosis patients. The vWF-related antigen (vWF:Rag), expressed in normal subjects, was reduced in polycythemia vera but normal in secondary erythrocytosis. The platelet function was also abnormal in these patients. These platelet alterations might be related to the pathophysiology of the polycythemia vera disease. to the statutes, we can go no further. We have no power to read into the statutes something not there. This is especially
